

When you are ready to export your project from Premiere for handover to audio, please follow the below instructions and screenshots to give them the correct file format.

1) Make sure you have named your audio tracks correctly

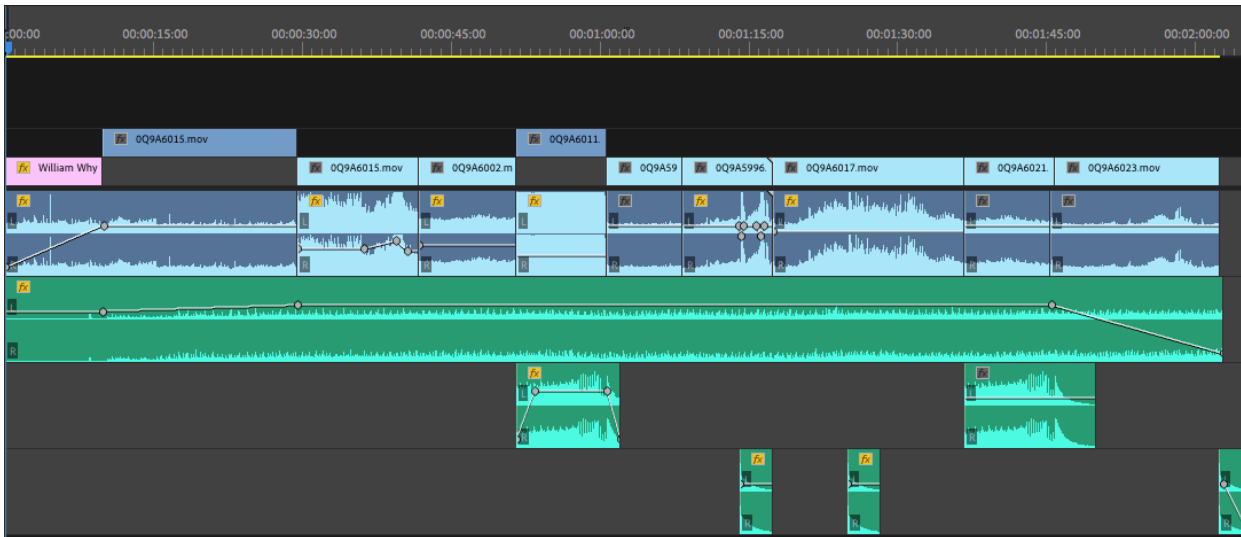

(Voice over // interview audio // atmos // etc):

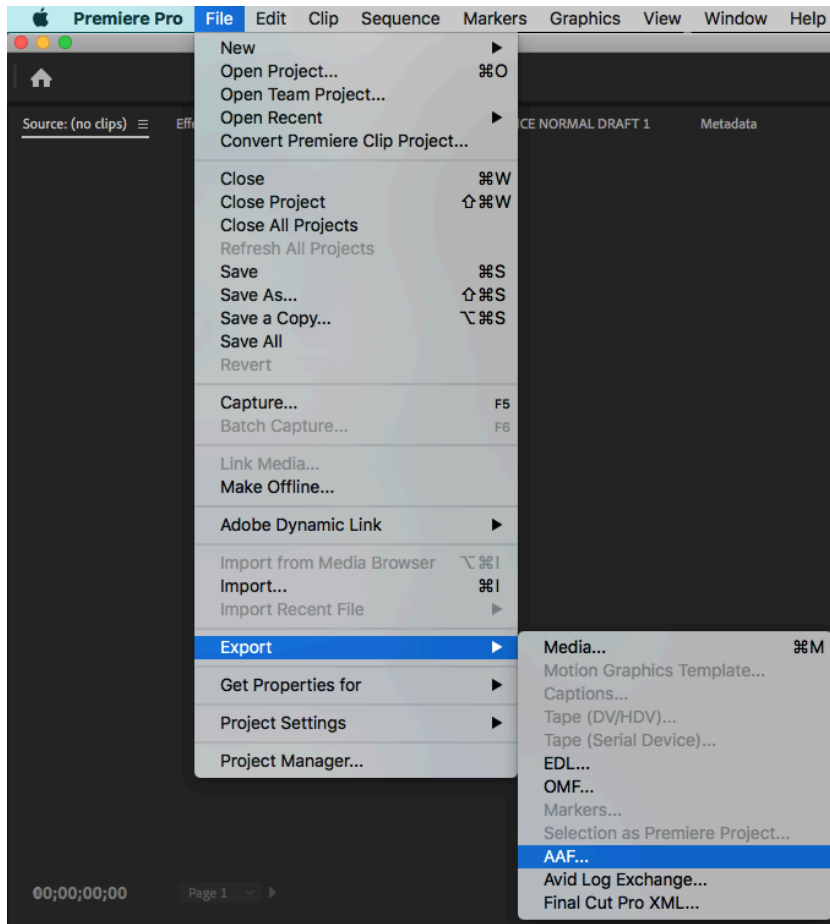

If you do not know how to re-name your audio tracks, go here:

[How To Rename Your Audio Tracks in Premiere Pro CC2018](#)

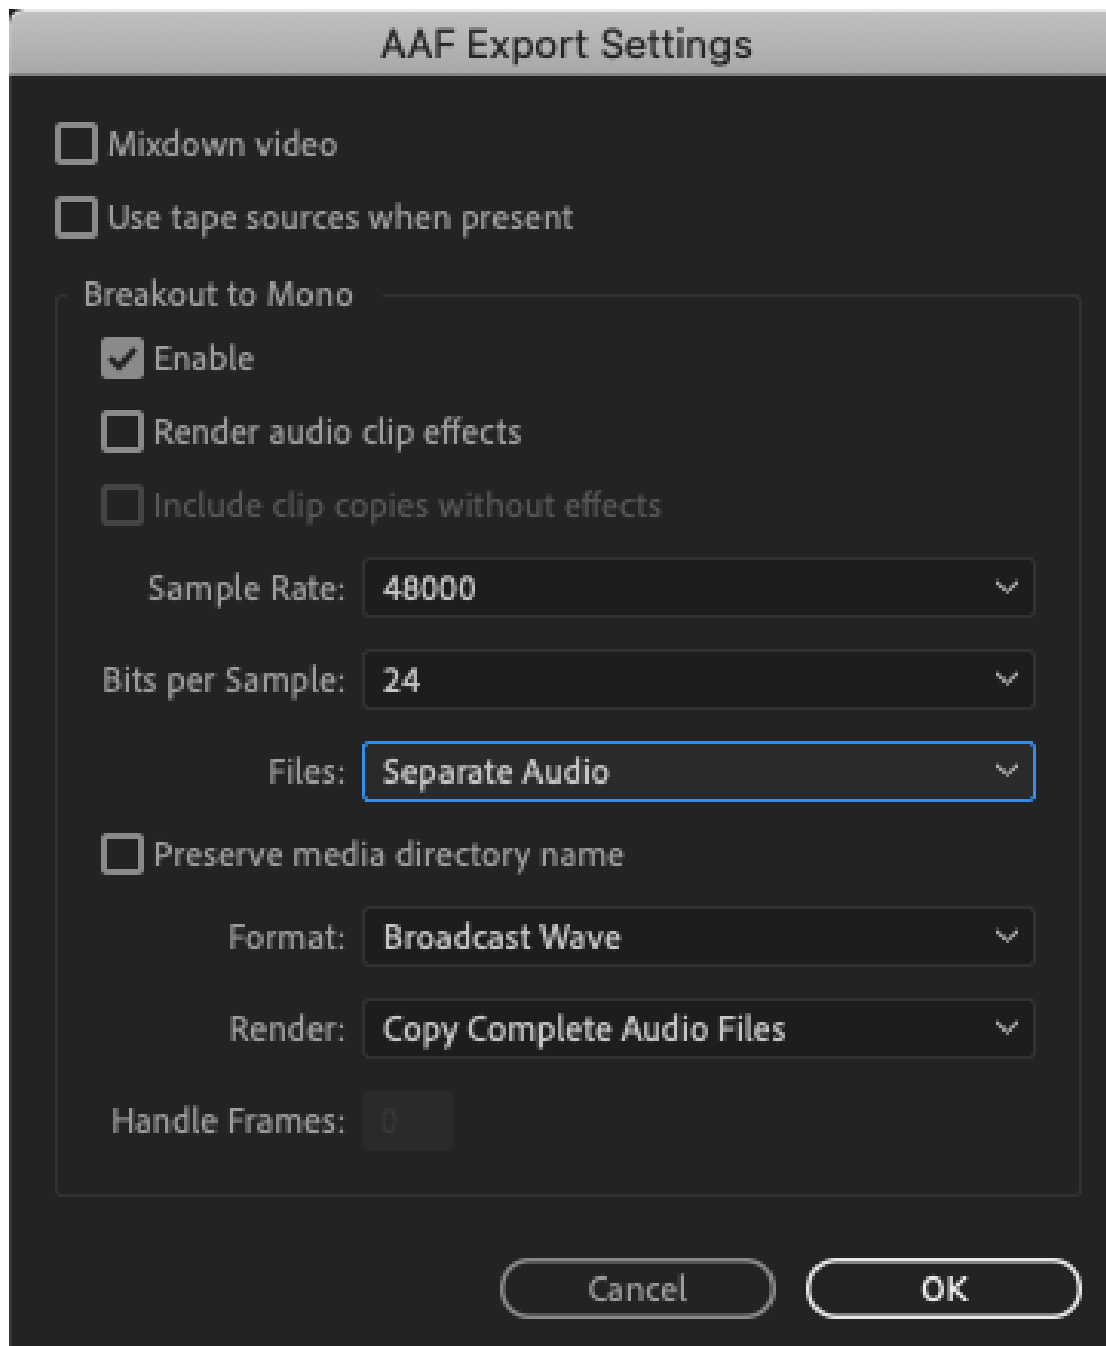

2) Make sure you mark In and Out points for the start and end of your entire project on the timeline:

3) File > Export > AAF

4) Set your AAF export settings the same as below:

The image shows a screenshot of the 'AAF Export Settings' dialog box. At the top, the title bar reads 'AAF Export Settings'. Below the title bar, there are two unchecked checkboxes: 'Mixdown video' and 'Use tape sources when present'. A section titled 'Breakout to Mono' contains a checked 'Enable' checkbox, and two unchecked checkboxes: 'Render audio clip effects' and 'Include clip copies without effects'. Below these are three dropdown menus: 'Sample Rate' set to '48000', 'Bits per Sample' set to '24', and 'Files' set to 'Separate Audio' (which is highlighted with a blue border). Below the dropdowns are two more unchecked checkboxes: 'Preserve media directory name', 'Format' set to 'Broadcast Wave', and 'Render' set to 'Copy Complete Audio Files'. At the bottom left is a 'Handle Frames' field with the value '0'. At the bottom right are 'Cancel' and 'OK' buttons.

AAF Export Settings

☐ Mixdown video

☐ Use tape sources when present

Breakout to Mono

☒ Enable

☐ Render audio clip effects

☐ Include clip copies without effects

Sample Rate: 48000

Bits per Sample: 24

Files: Separate Audio

☐ Preserve media directory name

Format: Broadcast Wave

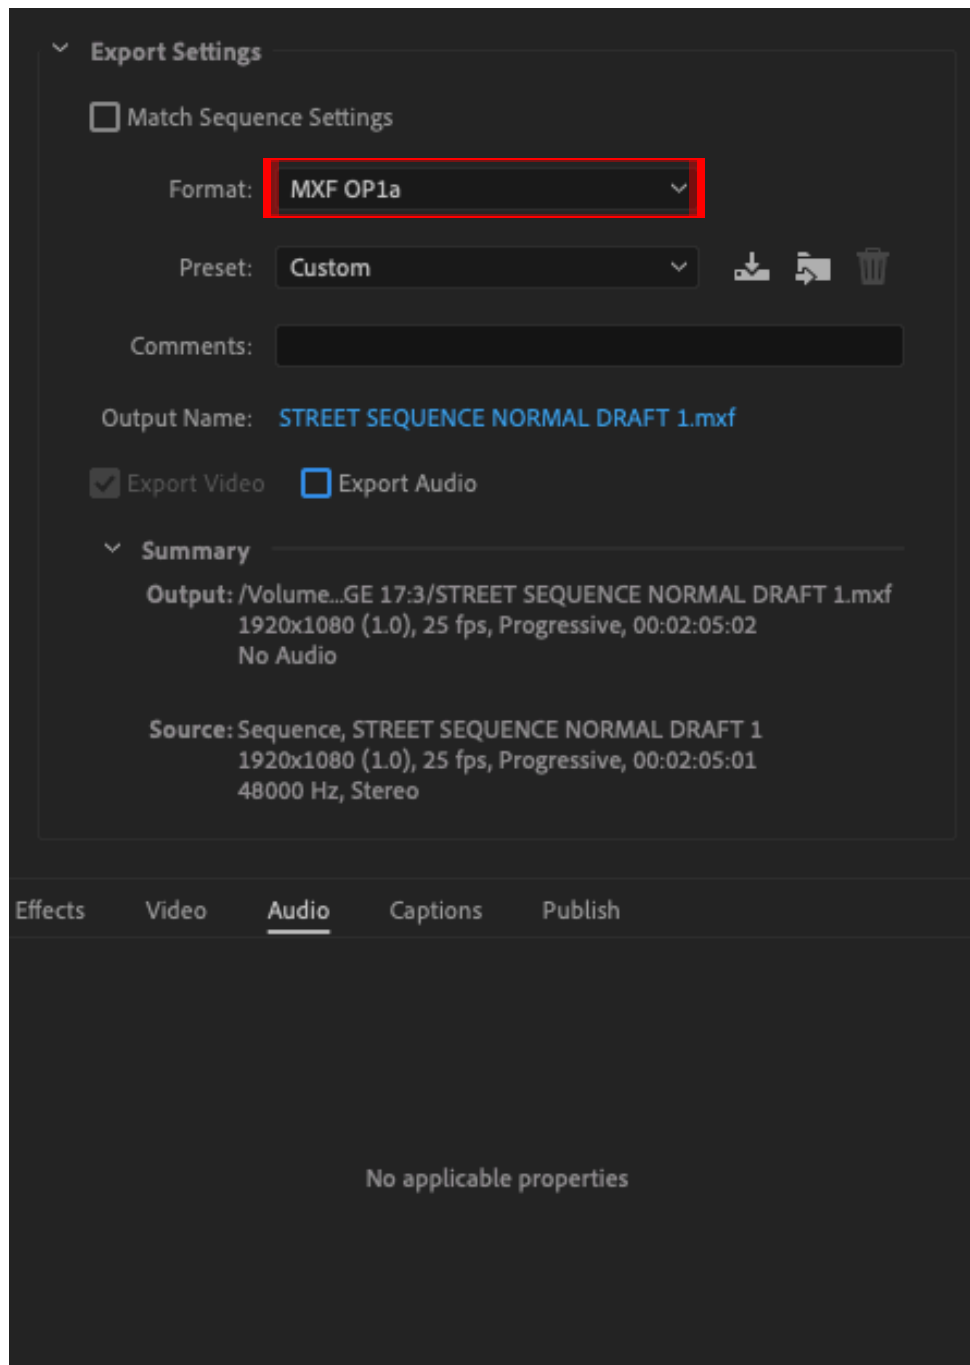

Render: Copy Complete Audio Files

Handle Frames: 0

Cancel OK

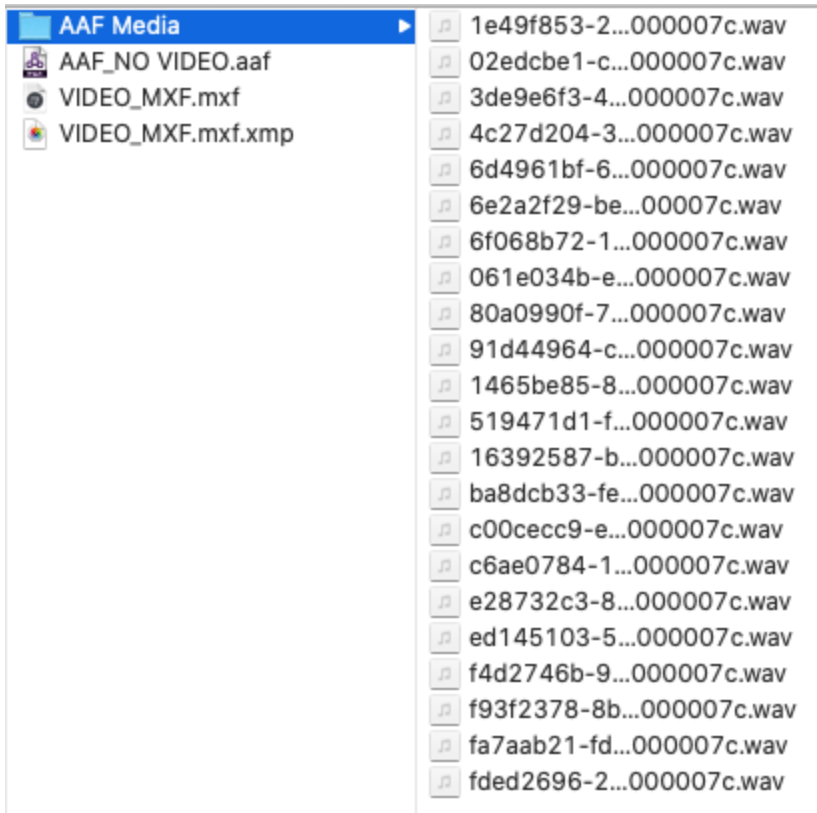

- ***Broadcast Wave is the industry standard .WAV audio format***

5) You will then have to do a separate export of a **VIDEO ONLY** file:

- *** Video DOES NOT** have to be MXF OP1a (this produces quite a large file)
- video format can be anything as long as you do **NOT** “*match bitrate*”.
- If your video is too large, try **H.264** – a good quality, reasonably sized video format.

6) Your finished exported files should look like this:

1. *AAF media folder with .wav files*
2. *.aaf file for opening in Pro Tools*
3. *.mxf // H.264 // other format **VIDEO ONLY** file*
4. *.xmp metadata file*

Handover the above files in an appropriately named folder to your audio students.
