

Set up GitHub and Sourcetree

WELCOME

GAD170 Programs Setup Video

1. Download **Unity Hub**
 - a. Sign in with student account using the Google icon, not by typing
 - b. Click pop up to open up Unity Hub
2. Download correct version of **Unity Editor** (2022.3.16f1 for 24T1)
 - a. Could do this by clicking Installs and be sent to Unity website to find it
 - b. Easier way is to click on the link provided and paste into Unity browser
 - i. This will open up in Unity Hub
3. Install with components
 - a. Microsoft Visual Studio Community 2022
 - b. Windows Build Support if on PC, Mac Build Support if on Mac
 - c. WebGL build
4. Optional: install 7-zip which used to be significantly faster than Windows at compressing files but Windows 11 is adding an improved compression system
<https://www.youtube.com/watch?v=8lVi749ATWs>
5. With Search, find the newly-installed **Visual Studio Installer** and open it
 - a. On Visual Studio Community 2022, click Modify
 - b. Check box for
 - i. .NET desktop environment
 - ii. Game development with Unity
 - c. Click Modify

WEEK ONE

GAD170 Version Control Video

1. Download **GitHub** and create GitHub account
 - a. Go to github.com
 - b. Sign up with student account
2. Create new GitHub repository in the cloud
 - a. New Repository
 - b. Name it
 - i. Async Activities
 - ii. Tutorials
 - iii. Projects 1, 2 and 3 eventually
 - c. Private
 - d. Add README
 - e. Add Unity .gitignore file
 - f. Create Repository
 - g. Optional: Code > copy the web url
3. Download **Sourcetree**
 - a. Go to <https://www.sourcetreeapp.com/>
 - b. Download for Mac or Windows
 - c. Open downloaded file
 - d. Skip BitBucket
 - e. Pick tools: Optional: Uncheck Mercurial
 - f. Type user name and SAE email address – this will be your signature for changes
 - g. Popup – Do you want to load in an SSH key? No
4. Set up Sourcetree account
 - a. In Sourcetree, click Remote
 - b. Add account
 - i. Change hosting service BitBucket to GitHub
 - ii. Refresh OAuth token
 1. Your default browser will open up asking you to allow permissions or log into GitHub
 2. If it asks for Windows credentials
 - a. select the bottom default one
 - b. Always
5. **Clone** GitHub repository onto home computer with Sourcetree
 - a. Find GitHub repo either by using Refresh and searching,
 - i. or by typing in the web url you copied from the GitHub website
 - b. Get to the clone page
 - i. Click Clone in the highlighted repo or click the Clone button at the top
 - c. Don't click Clone yet or you will clone into your Documents folder
 - d. In Windows Explorer (PC) or Finder (Mac), create an empty project folder with the perfect name in the perfect place

- e. On the Sourcetree clone page, copy the address of the project folder or Browse to it
 - f. Clone
 - g. Now the .git files are in the project folder and we need to put our Unity project in with them
6. Make a **new Unity project**
 - a. Open Unity Hub
 - b. New project
 - c. 3D Core
 - d. Temporary Name
 - e. Location: Select Folder of project folder with .github files in it
 - f. Create project
 - g. Unity project will open. Close it
7. In Windows Explorer or Finder: **Move** all Temporary Name Unity project files into project folder with the .github files in it
 - a. Check Assets folder is on same level as .github folder
 - b. Delete empty Temporary Name folder
8. **Initial commit** of Unity files to GitHub repository via Sourcetree
 - a. Open Sourcetree
 - b. Check no Library files in the list of Unstaged files
 - c. Type initial commit description
 - d. Stage All
 - e. Commit = ready to be pushed to online repository
 - f. Push = push to online repository
9. Correct the name of the Unity project in **Unity Hub**
 - a. Go to Unity Hub
 - b. Select Temporary Name project
 - c. Remove from list
 - d. Add
 - e. Navigate to Unity project folder with the .github and Assets folders in it
 - f. Open
 - g. Now Unity Hub has the correct name for the project and it opens the Unity project
10. **Clone to empty folder in new computer**
 - a. Download Sourcetree
 - b. Click Remote
 - c. Click on Sourcetree account
 - i. If you accidentally created a BitBucket account, ignore it and click on GitHub account
 - d. Find GitHub repo either by using Refresh and searching,
 - i. or by typing in the web url you can copy from the GitHub website
 - e. Get to the clone page
 - i. Click Clone in the highlighted repo or click the Clone button at the top
 - f. Don't click Clone yet or you will clone into your Documents folder
 - g. In Windows Explorer (PC) or Finder (Mac), create an empty project folder with the perfect name in the perfect place

- h. On the Sourcetree clone page, copy the address of the project folder or Browse to it
 - i. Clone
 - j. Now all of the files from the GitHub server have been downloaded onto this new computer
- 11. Add project in **Unity Hub**
 - a. Open Unity Hub
 - b. Add
 - c. Navigate to new project folder
 - d. Open
 - e. Now Unity Hub has the correct name for the project and it opens the Unity project

Sourcetree error

Sourcetree does not recognise .github repository
